# Review on "Hadamard Matrices its construction and some interesting properties" 

Monish Arora<br>Assistant Prof., Department of Mathematics, D.A.V College, Jalandhar

#### Abstract

In this paper we introduce Hadamard matrix, its definition, examples, construction of Hadamard matrices, its some properties and conclusion.

Keywords: Hadamard Matrix

## INTRODUCTION

A Hadamard matrix, Named after the French mathematician Jacques Hadamard, is square matrix whose entries are eithers +1 or -1 and whose rows are mutually orthogonal.

$$
\begin{gathered}
\text { For Example } H_{2}=\left[\begin{array}{rr}
1 & -1 \\
1 & 1
\end{array}\right] \begin{array}{l}
R_{1} \\
R_{2}
\end{array} \\
\text { Clearly } R_{1} R_{2}=0
\end{gathered}
$$

## So Rows are orthogonal

It is a Hadamard matrix of order 2 Columns in Hadamard matrix are also mutually orthogonal.

## CONSTRUCTION

In 1867, James, Joseph Sylvester constructed Hadamard matrix in the following manner.

$$
\begin{gathered}
\text { Replace } 1 \text { by } H_{2} \\
\text { And }-1 \text { by }-H_{2} \text { in } H_{2} \text {, we get } H_{4} \\
\text { So } H_{4}=\left[\begin{array}{cc}
H_{2} & -H_{2} \\
H_{2} & H_{2}
\end{array}\right] \\
=\left[\begin{array}{rrrr}
1 & -1 & -1 & -1 \\
1 & 1 & -1 & 1 \\
1 & -1 & 1 & -1 \\
1 & 1 & 1 & 1
\end{array}\right] 4 \times 4
\end{gathered}
$$

## Clearly

$H_{4}$ is a Hadamard matrix of order 4. By using same proc and -1 by $-H_{2}$ in $H_{4}$, We get $H_{8}$, we get $H_{8}$ again a Hadamard matrix of order 8
It become a chain of Hadamard matrices very amazing

| Order | 2 | $4=2^{2}$ |
| :--- | :--- | :--- |
| $2^{3}$ | $16=2^{4}$ | $8=$ |

So Sylvester constructed Hadamard matrices of order $2^{n}$ where n is a tve integer properties

$$
\begin{gathered}
H_{2}^{T}=\left[\begin{array}{rr}
1 & 1 \\
-1 & 1
\end{array}\right] \\
\text { Then } H_{2} H_{2}^{T}=\left[\begin{array}{rr}
1 & -1 \\
1 & 1
\end{array}\right]\left[\begin{array}{ll}
1 & 1 \\
1 & 1
\end{array}\right] \\
=\left[\begin{array}{ll}
2 & 0 \\
0 & 2
\end{array}\right]=2\left[\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right] \\
=2 I_{2}
\end{gathered}
$$

In general the property is

$$
H_{n} H_{n}^{T}=n I_{n}
$$

Where $H_{n}$ is a Hadamard matrix.
Further if we multiply any row (column) of a Hadamard matrix -1 then the resulting matrix is again a Hadamard matrix.

If we interchange any two rows (or columns) of a Hadamard matrix, even then resulting matrix is a Hadamard matrix.

In 1893 Hadamard constructed matrices of order 12 and 20. So $H_{12}$ and $H_{20}$ are missing Hadamard matrices in the Sylvester constructed Hadamard matrices. $H_{2}, H_{4}, H_{8}, H_{16}, H_{32} \ldots$

Recently Hadi Kharaghani and Behruz Tayfeh Rezaie
 Hadamard matrix of order 428. As of 2008 there are 13 multiples of 4 less than or equal to 2000 for which no Hadamard matrix of that order is known.

They are $668,716,892,1004,1132,1244,1388,1436$, 1676, 1772, 1916, 1948, 1964.

## Construction of a Hadamard matrix by J. Williamson method

First, we study some properties and some concepts required for the J . Williamson method.

## PROPERTY

If we multiply any row (column) of a Hadamard matrix by -1 , then the resulting matrix is again a Hadamard matrix.

If we interchange any two row (or column) of a Hadamard matrix, even then the resulting matrix is a Hadamard matrix.

## CIRCULANT MATRIX

The matrix of type $\left[\begin{array}{ccc}a & b & c \\ c & a & b \\ -b & c & a\end{array}\right]$ is called a circulant matrix. It is denoted by circ (abc).

| Example | $-\left(\begin{array}{llll}1 & 1 & 1 & \\ -1 & 1 & 1 & \begin{array}{l}\text { is a circulant matrix. It } \\ \text { is } \begin{array}{c}\text { also } \\ \text { matrix. }\end{array} \\ \text { Hadamard }\end{array} \\ 1 & - & 1 & \\ 1 & 1 & 1 & - \\ 1 & & & \end{array}\right)$ |
| :---: | :---: |

It is the only known circulant matrix, which is a Hadamard matrix.

Product (or sum) of two circulant matrices is a circulant matrix.

Inverse of a circulant matrix is a circulant matrix.

$$
\begin{aligned}
& \text { Let } \square \square \quad=\quad \operatorname{circ}\left(\begin{array}{lll}
0 & 1 & 0
\end{array}\right) \\
& \text { then } \square^{2}= \\
& =\quad\left(\begin{array}{lll}
0 & 1 & 0 \\
0 & 0 & 1 \\
1 & 0 & 0
\end{array}\right)\left(\begin{array}{lll}
0 & 1 & 0 \\
0 & 0 & 1 \\
1 & 0 & 0
\end{array}\right) \\
& =\quad\left(\begin{array}{lll}
0 & 0 & 1 \\
1 & 0 & 0 \\
0 & 1 & 0
\end{array}\right) \\
& =\quad \operatorname{circ}\left(\begin{array}{lll}
0 & 0 & 1
\end{array}\right) \\
& \text { Also } \square \square^{3} \quad=\quad \square^{\square} \square \\
& =\quad \operatorname{circ}\left(\begin{array}{lll}
1 & 0 & 0
\end{array}\right) \\
& =\quad\left(\begin{array}{lll}
1 & 0 & 0 \\
0 & 1 & 0 \\
0 & 0 & 1
\end{array}\right)=I_{3}
\end{aligned}
$$

$$
\therefore \quad \square^{3}=\mathrm{I}
$$

$$
\begin{array}{ll}
\Rightarrow & \square^{\square} \cdot \square=\mathrm{I} \\
\therefore & \square^{\square \square}=\square^{\square}
\end{array}
$$

$$
\text { Also } \quad \square^{\mathrm{T}}=\left(\begin{array}{lll}
0 & 0 & 1 \\
1 & 0 & 0 \\
0 & 1 & 0
\end{array}\right)
$$

$\therefore \quad \square^{\square}=\square^{\square}$
$\therefore \quad$ From above, we have
$\square^{\square}=\square^{\square \square}=\square \square \quad$ where $\square=\operatorname{circ}\left(\begin{array}{lll}0 & 1 & 0\end{array}\right)$

## WILLIAMSON'S METHOD STATEMENT

If $\mathrm{A}, \mathrm{B}, \mathrm{C}$ and D are four symmetric and circulant matrices of order $t$ whose entries are +1 and -1 such that it satisfies

$$
\mathrm{A}^{2}+\mathrm{B}^{2}+\mathrm{C}^{2}+\mathrm{D}^{2}=4 \mathrm{t} \mathrm{I}_{\mathrm{t}}
$$

The matrices A, B, C and D are known as Williamson's matrices of order t . Where as H is a Hadamard matrix of order 4 t .

## To construct a Hadamard matrix of order 12.

$$
\begin{gathered}
\text { Order }=12=4(3) \\
\therefore \quad \text { we take } \mathrm{t}=3 \\
\square^{2}=\begin{array}{c}
\text { circ }\left(\begin{array}{lll}
0 & 0 & 1
\end{array}\right)
\end{array} \\
\\
\therefore=\operatorname{circ}\left(\begin{array}{lll}
0 & 1 & 0
\end{array}\right) \\
\operatorname{circ}\left(\begin{array}{lll}
0 & 1 & 0
\end{array}\right)+\operatorname{circ}\left(\begin{array}{lll}
0 & 0 & 1
\end{array}\right) \\
\\
\operatorname{circ}\left(\begin{array}{lll}
0 & 1 & 1
\end{array}\right) \\
\\
\left(\begin{array}{lll}
0 & 1 & 1 \\
1 & 0 & 1 \\
1 & 1 & 0
\end{array}\right)
\end{gathered}
$$

$\begin{array}{cc}\text { Now } & \text { neither } \square \text { nor } \square^{2} \text { are } \\ \text { symmetric matrix. } \\ \text { but } & \square \square \square \square \square \square \text { is a symmetric }\end{array}$ matrix.

| Let | $\mathrm{A}=\square^{3}+\square+\square^{2}$ |
| :--- | :--- |
| or | $\mathrm{A}=\mathrm{I}+\square+\square^{2}$ |

$$
\begin{aligned}
& \text { or } \quad \mathrm{A}=\mathrm{I}+\mathrm{w}_{1} \quad \text { where } \\
& \mathrm{w}_{1}=\square+\square^{2}
\end{aligned}
$$

Also Let $\quad$| B | $=\mathrm{I}-\mathrm{w}_{1}$ |
| ---: | :--- |
| C | $=\mathrm{I}-\mathrm{w}_{1}$ |
| D | $=\mathrm{I}-\mathrm{w}_{1}$ |

Then clearly A, B, C and D are all symmetric as well as circulant matrices with entries +1 or -1 .

```
Now \(\quad w_{1}^{2}=\left(\square+\square^{2}\right)^{2}=\left(\square+\square^{-1}\right)^{2}=\square^{\square}+\square^{-2}+\)
\(2 \square \square^{-1}\)
    \(=\square^{-1}+\)
\(\square+2 \mathrm{I}\)
```

2I

$$
\therefore \quad \mathrm{A}^{2}=\left(\mathrm{I}+\mathrm{w}_{1}\right)^{2} \quad=\mathrm{I}+2 \mathrm{w}_{1}+w_{1}^{2}
$$

$$
=\mathrm{I}+2 \mathrm{w}_{1}+\mathrm{w}_{1}+2 \mathrm{I}
$$

$$
\therefore \quad \mathrm{A}^{2} \quad=3\left(\mathrm{I}+\mathrm{w}_{1}\right)
$$

Also

$$
\begin{aligned}
& \mathrm{B}^{2} \\
& =\mathrm{I}-2 \mathrm{w}_{1}+w_{1}^{2} \\
& =\mathrm{I}-2 \mathrm{w}_{1}+\mathrm{w}_{1}+2 \mathrm{I} \\
\therefore \quad & \mathrm{~B}^{2}
\end{aligned} \quad=3 \mathrm{I}-\mathrm{w}_{1} .
$$

| Also |  | $\mathrm{C}^{2}=3 \mathrm{I}-\mathrm{w}_{1} \quad \&$ | $\mathrm{D}^{2}=3 \mathrm{I}-$ |
| :--- | :--- | :--- | :--- |
| $\mathrm{w}_{1}$ |  |  |  |
| Now |  | $\mathrm{A}^{2}+\mathrm{B}^{2}+\mathrm{C}^{2}+\mathrm{D}^{2}$ | $=$ |
|  | 12 I |  | $=$ |
|  |  |  |  |

(3) I
$\therefore \quad$ It satisfies $\quad A^{2}+B^{2}+C^{2}+D^{2}=4 t I_{t}$
Now

$$
\begin{aligned}
\mathrm{A} & =\mathrm{I}+\mathrm{w}_{1} \\
& =\left[\begin{array}{lll}
1 & 0 & 0 \\
0 & 1 & 0 \\
0 & 0 & 1
\end{array}\right]+\left[\begin{array}{lll}
0 & 1 & 1 \\
1 & 0 & 1 \\
1 & 1 & 0
\end{array}\right]=
\end{aligned}
$$

| and   <br> $\operatorname{cir}\left(\begin{array}{lll}0 & 1 & 1\end{array}\right)$  $=\operatorname{circ}\left(\begin{array}{lll}1 & 0 & 0\end{array}\right)-$ <br> 1   | $=\operatorname{circ}\left(\begin{array}{ll}1 & -1\end{array}-\right.$ |
| :--- | :--- |
|  |  |
|  | $=\left[\begin{array}{ccc}1 & -1 & -1 \\ -1 & 1 & -1 \\ -1 & -1 & 1\end{array}\right]$ |
| $B=\operatorname{circ}\left(\begin{array}{lll}1 & -1 & -1\end{array}\right)$ | $C=D=$ |

$\therefore \quad$ Hadamard matrix of order 12 will be
$\left(\begin{array}{cccc}\mathrm{A} & \mathrm{B} & \mathrm{C} & \mathrm{D} \\ -\mathrm{B} & \mathrm{A} & \mathrm{D} & -\mathrm{C} \\ -\mathrm{C} & -\mathrm{D} & \mathrm{A} & \mathrm{B} \\ -\mathrm{D} & \mathrm{C} & -\mathrm{B} & \mathrm{A} \\ & & & \end{array}\right)$

Put matrices A, B, C, D in above, we get $\mathrm{H}_{12}$
If H is a Hadamard matrix of order n . Then
(i) $H H^{T}=n \mathrm{I}_{n}$
(ii) $[\operatorname{detH}]=n^{\frac{1}{2} n}$
(iii) $H H^{T}=H^{T} H$
(iv) Hadamard matrices may be changed into other Hadamard matrices by different arrangements of rows and column and by multiplying rows and column by -1 . The matrices so obtained are known as H -equivalent.
(v) Every Hadmard martrix is H-equivalent to an Hadamard matrix which has every element of the its first row and column +1 .

These latter matrices are called normalized.
(vi) If H is a normalized hadamard martrix of order $4 n$, them every row (column) except the first has 2 n minus ones and 2 n plus ones in each row (column).

Further n minus ones in any row (column) overlap with n minus ones in each other row (column)
(vii) the order of an Hadamard matrix is 1,2 or 4 n , n positive integer.

Theorm If a Hadamard matrix of order n exists then $n=1,2$ or a multiple of 4 .

Suppose $\mathrm{n}>2$ and standardize $\mathrm{H}_{\mathrm{n}}$
Permute columns so that

| + + . . + + | + + . . + + | + + . . + + | + + . . + + |
| :---: | :---: | :---: | :---: |
| + + . . + + | + + . . + + | - -...-- | - -...- |
| + + . . + + | - -...-- | + + . . + + | - -...- |
| p | q | r | S |

then $\mathrm{p}+\mathrm{q}+\mathrm{r}+\mathrm{s}=\mathrm{n}$ the length of the vectors
$\mathrm{p}+\mathrm{q}-\mathrm{r}-\mathrm{s}=0$ Row1 and Row2 are orthogonal
$\mathrm{p}-\mathrm{q}-\mathrm{r}+\mathrm{s}=0$ Row 2 and Row3 are orthogonal
$\mathrm{p}-\mathrm{q}+\mathrm{r}-\mathrm{s}=0$ Row 3 and Row 1 are orthogonal
Therefore, we have $\mathrm{n}=4 \mathrm{a}$
Also $\mathrm{n}=4 \mathrm{~b}=4 \mathrm{c}=4 \mathrm{~d}$
So if a Hadamard matrix of order $n$ exists then the order n must be either 1,2 or a multiple of 4 .

## APPLICATIONS

Hadamard matrices have application in Error correcting codes, Modern CDMA Cellphones, pattern recognition, neuroscience optical communication and information hiding.

## CONCLUSION

Although Hadamard matrices look simple but have interesting properties and very productive applications.
