**Abstract:** In this Paper we introduce a new class of sets called  $\pi$  generalized  $\wedge b^*$ -closed set (briefly  $\pi g^{\wedge} b^*$ -closed) and some of its characteristics are investigated. Further we studied the concepts of  $\pi g^{\wedge} b^*$ -open sets and  $\pi g^{\wedge} b^*$ - $T_{1/2}$  space.

**Key words:**  $\pi g^{\wedge} b^*$ -closed sets,  $\pi g^{\wedge} b^*$ -open sets,  $\pi g^{\wedge} b^*$ - $T_{1/2}$  space,  $\pi g^{\wedge} b^*$ -closure operator.

## I. INTRODUCTION

Levine[11] and Andrijevic[3] introduced the concept of generalized open sets and b-open sets respectively in topological spaces. The class of b-open sets is contained in the class of semipre-open sets and contains the class of semi-open and the class of pre-open sets. Since then several researches were done and the notion of generalized semi-closed, generalized pre-closed and generalized semipre-open sets were investigated. In 1968 Zaitsev[19] defined  $\pi$ -closed sets. Later Dontchev and Noiri[8] introduced the notion of  $\pi g$ -closed sets. Park[15] defined  $\pi gp$ -closed sets. Then Aslim, Caksu and Noir[4] introduced the notion of  $\pi gs$ -closed sets. The idea of  $\pi gb$ -closed sets were introduced by D.Sreeja and C. Janaki[18]. Later the properties and characteristics of  $\pi gb$ -closed sets were introduced by Sinem Caglar and Gulhan Ashim[17]. The aim of this paper is to investigate the notion of  $\pi g^{\wedge} b^*$ -closed sets and its properties. In section 3 we study the basic properties of  $\pi g^{\wedge} b^*$ -closed sets. In section 4 some characteristics of  $\pi g^{\wedge} b^*$ -closed sets are introduced and the idea of  $\pi g^{\wedge} b^*$ - $T_{1/2}$  space is discussed.

## II. PRELIMINARIES

Throughout this paper  $(X, \tau)$  represents non empty topological spaces on which no separation axioms are assumed unless otherwise mentioned. A subset  $A$  of a topological space  $(X, \tau)$ ,  $cl(A)$  and  $int(A)$  denote the closure of  $A$  and interior of  $A$  respectively.  $(X, \tau)$  will be replaced by  $X$  if there is no chance of confusion.

Definition: Let  $(X, \tau)$  be a topological space. A subset  $A$  of  $(X, \tau)$  is called

- (1) a semi-closed set if  $int(cl(A)) \subseteq A$ .
- (2) a  $\alpha$ -closed set if  $cl(int(cl(A))) \subseteq A$ .
- (3) a pre-closed set if  $cl(int(A)) \subseteq A$ .
- (4) a semipre-closed set if  $int(cl(int(A))) \subseteq A$ .
- (5) a regular-closed set if  $A = cl(int(A))$ .
- (6) a b-closed set if  $cl(int(A)) \cap int(cl(A)) \subseteq A$ .
- (7) a  $b^*$ -closed set if  $int(cl(A)) \subset U$ , whenever  $A \subset U$  and  $U$  is b-open.

the complements of the above mentioned sets are called semi-open,  $\alpha$ -open, pre-open, semi-open, regular open, b-open,  $b^*$ -open sets respectively. The intersection of all

semi-closed (resp.  $\alpha$ -closed, pre-closed, semipre-closed, regular-closed and b-closed) subsets of  $(X, \tau)$  containing  $A$  is called the semi-closure (resp.  $\alpha$ -closure, pre-closure, semipre-closure, regular-closure and b-closure) of  $A$  and is denoted by  $scl(A)$  (resp.  $\alpha cl(A)$ ,  $pcl(A)$ ,  $spcl(A)$ ,  $rcl(A)$  and  $bcl(A)$ ). A subset  $A$  of  $(X, \tau)$  is called clopen if it is both open and closed in  $(X, \tau)$ .

### Definition

A subset  $A$  of a space  $(X, \tau)$  is called  $\pi$ -closed if  $A$  is finite intersection of regular closed sets.

### Definition

A subset  $A$  of a space  $(X, \tau)$  is called

- (1) a g-closed set if  $cl(A) \subset U$  whenever  $A \subset U$  and  $U$  is open in  $(X, \tau)$ .
- (2) a gp-closed set if  $pcl(A) \subset U$  whenever  $A \subset U$  and  $U$  is open in  $(X, \tau)$ .
- (3) a gs-closed set if  $scl(A) \subset U$  whenever  $A \subset U$  and  $U$  is open in  $(X, \tau)$ .
- (4) a gb-closed set if  $bcl(A) \subset U$  whenever  $A \subset U$  and  $U$  is open in  $(X, \tau)$ .
- (5) a  $g\alpha$ -closed set if  $\alpha cl(A) \subset U$  whenever  $A \subset U$  and  $U$  is open in  $(X, \tau)$ .
- (6) a  $\pi g$ -closed set if  $cl(A) \subset U$  whenever  $A \subset U$  and  $U$  is  $\pi$ -open in  $(X, \tau)$ .
- (7) a  $\pi g\alpha$ -closed set if  $\alpha cl(A) \subset U$  whenever  $A \subset U$  and  $U$  is  $\pi$ -open in  $(X, \tau)$ .
- (8) a  $\pi gp$ -closed set if  $pcl(A) \subset U$  whenever  $A \subset U$  and  $U$  is  $\pi$ -open in  $(X, \tau)$ .
- (9) a  $\pi gs$ -closed set if  $scl(A) \subset U$  whenever  $A \subset U$  and  $U$  is  $\pi$ -open in  $(X, \tau)$ .
- (10) a  $\pi gb$ -closed set if  $bcl(A) \subset U$  whenever  $A \subset U$  and  $U$  is  $\pi$ -open in  $(X, \tau)$ .

Complement of  $\pi$ -closed set is called  $\pi$ -open set.

Complement of g-closed, gp-closed, gs-closed, gb-closed,  $g\alpha$ -closed,  $\pi g\alpha$ -closed,  $\pi gp$ -closed,  $\pi gs$ -closed and  $\pi gb$ -closed sets are called g-open, gp-open, gs-open, gb-open,  $g\alpha$ -open,  $\pi g\alpha$ -open,  $\pi gp$ -open,  $\pi gs$ -open and  $\pi gb$ -open sets respectively.

### Definition

Let  $(X, \tau)$  be a topological space then a set  $A \subset (X, \tau)$  is said to be Q-set if  $int(cl(A)) = cl(int(A))$ .

### III. $\pi g^*b^*$ -CLOSED SETS IN TOPOLOGICAL SPACES

**Definition**

A subset  $A$  of a space  $(X, \tau)$  is called  $\pi g^*b^*$ -closed set if  $\text{int}(\text{bcl}(A)) \subset U$  whenever  $A \subset U$  and  $U$  is  $\pi g$ -open in  $(X, \tau)$ .

**Theorem: 3.1**

Every  $g$ -closed set is  $\pi g^*b^*$ -closed.

**Proof**

Let  $A$  be a  $g$ -closed set of  $(x, \tau)$  such that  $A \subseteq U$  and  $U$  is  $\pi g$ -open in  $X$ . Since  $\text{cl}(A) \subset U$ . As  $\text{bcl}(A) \subset \text{cl}(A) \subset U$ ,  $\text{int}(\text{bcl}(A)) \subseteq \text{int}(U) = U$ . Hence  $A$  is  $\pi g^*b^*$ -closed.

**Remark: 3.1**

The converse of the above theorem is not true as seen from the following example.

**Example: 3.1**

Let  $X = \{a, b, c\}$  and  $\tau = \{X, \Phi, \{a\}, \{b\}, \{a, b\}\}$ . Let  $A = \{a, b\}$ . Then  $A$  is  $\pi g^*b^*$ -closed but not  $g$ -closed.

**Theorem: 3.2**

Every  $\pi$ -closed set is  $\pi g^*b^*$ -closed.

**Proof**

Let  $A$  be a  $\pi$ -closed set and  $A \subseteq U$ ,  $U$  is  $\pi g$ -open. since  $\pi \text{cl}(A) = A$ ,  $\text{int}(\text{bcl}(A)) \subset \pi \text{cl}(A) = A$ , therefore  $\text{int}(\text{bcl}(A)) \subset A$  whenever  $A \subset U$  and  $U$  is  $\pi g$ -open. Hence  $A$  is  $\pi g^*b^*$ -closed.

**Remark: 3.2**

The converse of the above theorem is not true as seen from the following example.

**Example: 3.2**

Let  $X = \{a, b, c, d\}$  and  $\tau = \{X, \Phi, \{a\}, \{b\}, \{a, b\}, \{b, c\}, \{a, b, c\}, \{a, b, d\}\}$ . Let  $A = \{a, c, d\}, \{a, c\}$ . Then  $A$  is  $\pi g^*b^*$ -closed but not  $\pi$ -closed.

**Theorem: 3.3**

Every closed set is  $\pi g^*b^*$ -closed.

**Proof**

Let  $A$  be a closed set of  $(x, \tau)$  such that  $A \subseteq U$  and  $U$  is  $\pi g$ -open in  $X$ . since  $\text{bcl}(A) \subset \text{cl}(A) = A$ ,  $\text{int}(\text{bcl}(A)) \subset \text{int}(A) \subseteq \text{int}(U) = U$ . Hence  $A$  is  $\pi g^*b^*$ -closed.

**Remark: 3.3**

The converse of the above theorem is not true as seen from the following example.

**Example: 3.3**

Let  $X = \{a, b, c\}$  and  $\tau = \{X, \Phi, \{a\}, \{b\}, \{a, b\}\}$ . Let  $A = \{b\}$ . Then  $A$  is  $\pi g^*b^*$ -closed but not closed.

**Theorem: 3.4**

Every  $\alpha$ -closed set is  $\pi g^*b^*$ -closed.

**Proof**

Let  $A$  be a  $\alpha$ -closed set of  $(x, \tau)$  such that  $A \subseteq U$  and  $U$  is  $\pi g$ -open in  $X$ . Since  $\text{bcl}(A) \subset \alpha \text{cl}(A) = A$ ,  $\text{int}(\text{bcl}(A)) \subset \text{int}(A) \subseteq \text{int}(U) = U$ . Hence  $A$  is  $\pi g^*b^*$ -closed.

**Remark: 3.4**

The converse of the above theorem is not true as seen from the following example.

**Example: 3.4**

Let  $X = \{a, b, c\}$  and  $\tau = \{X, \Phi, \{a\}, \{b\}, \{a, b\}\}$ . Let  $A = \{a\}$ . Then  $A$  is  $\pi g^*b^*$ -closed but not  $\alpha$ -closed.

**Theorem: 3.5**

Every pre closed set is  $\pi g^*b^*$ -closed.

**Proof**

Let  $A$  be a pre closed set of  $(x, \tau)$  such that  $A \subseteq U$  and  $U$  is  $\pi g$ -open in  $X$ . Since  $\text{bcl}(A) \subset \text{pcl}(A) = A$ ,  $\text{int}(\text{bcl}(A)) \subset \text{int}(A) \subseteq \text{int}(U) = U$ . Hence  $A$  is  $\pi g^*b^*$ -closed.

**Remark: 3.5**

The converse of the above theorem is not true as seen from the following example.

**Example: 3.5**

Let  $X = \{a, b, c, d\}$  and  $\tau = \{X, \Phi, \{a\}, \{d\}, \{a, d\}, \{c, d\}, \{a, c, d\}\}$ . Let  $A = \{c, d\}$ . Then  $A$  is  $\pi gb^{**}$ -closed but not pre closed.

**Theorem: 3.6**

Every  $gb$ -closed set is  $\pi g^*b^*$ -closed.

**Proof**

Let  $A$  be a  $gb$ -closed set of  $(x, \tau)$  such that  $A \subseteq U$  and  $U$  is  $\pi g$ -open in  $X$ . since every  $\pi g$ -open set is open.  $\text{bcl}(A) \subset U$ . Thus  $\text{int}(\text{bcl}(A)) \subseteq \text{int}(U) = U$ . Hence  $A$  is  $\pi g^*b^*$ -closed.

**Remark: 3.6**

The converse of the above theorem is not true as seen from the following example.

**Example: 3.6**

Let  $X = \{a, b, c, d\}$  and  $\tau = \{X, \Phi, \{b\}, \{c, d\}, \{b, c, d\}\}$ . Let  $A = \{b, d\}$ . Then  $A$  is  $\pi gb^{**}$ -closed but not  $\alpha$ -closed.

**Theorem: 3.7**

Every  $\pi g\alpha$ -closed set is  $\pi g^*b^*$ -closed.

**Proof**

Let  $A$  be a  $\pi g\alpha$ -closed set of  $(x, \tau)$  such that  $A \subseteq U$  and  $U$  is  $\pi g$ -open in  $X$ . Then  $\alpha \text{cl}(A) \subset U$ ,  $\text{bcl}(A) \subset \alpha \text{cl}(A) \subset U$ ,  $\text{int}(\text{bcl}(A)) \subset \text{int}(A) \subseteq \text{int}(U) = U$ . Hence  $A$  is  $\pi g^*b^*$ -closed.

**Remark: 3.7**

The converse of the above theorem is not true as seen from the following example.

**Example: 3.7**

Let  $X = \{a, b, c\}$  and  $\tau = \{X, \Phi, \{a\}, \{b\}, \{a, b\}, \{a, c\}\}$ . Let  $A = \{a\}$ . Then  $A$  is  $\pi g^*b^*$ -closed but not  $\pi g\alpha$ -closed.

**Theorem: 3.8**

Every  $\pi g^*b^*$ -closed set is  $\pi gb$ -closed.

**Proof**

Let  $A$  be a  $\pi g^*b^*$ -closed set of  $(X, \tau)$  such that  $A \subseteq U$  and  $U$  is  $\pi$ -open in  $X$ . since  $A$  is  $\pi g^*b^*$ -closed set,  $bcl(A) \subseteq U$  and, hence  $bcl(A) \subseteq U$ . Then  $A$  is  $\pi gb$ -closed.

**Remark: 3.8**

The converse of the above theorem is not true as seen from the following example.

**Example: 3.8**

Let  $X = \{a, b, c, d\}$  and  $\tau = \{X, \Phi, \{a\}, \{b\}, \{a, b\}, \{a, b, c\}, \{a, b, d\}\}$ . Let  $A = \{a, b, c\}$ . Then  $A$  is  $\pi gb$ -closed but not  $\pi g^*b^*$ -closed.

**Theorem: 3.9**

Every  $\pi g^*b^*$ -closed set is  $\pi gs$ -closed.

**Proof**

Let  $A$  be a  $\pi g^*b^*$ -closed set of  $(X, \tau)$  such that  $A \subseteq U$  and  $U$  is  $\pi$ -open in  $X$ . since  $A$  is  $\pi g^*b^*$ -closed set,  $intbcl(A) \subseteq U$  and, hence  $bcl(A) \subseteq scl(A) \subseteq U$ ,  $bcl(A) \subseteq U$ . Then  $A$  is  $\pi gs$ -closed.

**Remark: 3.9**

The converse of the above theorem is not true as seen from the following example.

**Example: 3.9**

Let  $X = \{a, b, c, d\}$  and  $\tau = \{X, \Phi, \{b\}, \{b, c\}\}$ . Let  $A = \{a, b, d\}$ . Then  $A$  is  $\pi gs$ -closed but not  $\pi g^*b^*$ -closed.

**Remark: 3.10**

The concept of  $\pi gp$ -closed set and  $\pi g^*b^*$ -closed set are independent of each other. It is shown in the following example.

**Example: 3.10**

Let  $X = \{a, b, c\}$  and  $\tau = \{X, \Phi, \{a\}, \{b\}, \{a, b\}, \{a, c\}\}$ . In this topological space the subset  $A = \{a, b\}$  is  $\pi gp$ -closed but not  $\pi g^*b^*$ -closed set and the subset  $B = \{a\}$  is  $\pi g^*b^*$ -closed but not  $\pi gp$ -closed set.

**Remark: 3.11**

The concept of  $\pi g$ -closed set and  $\pi g^*b^*$ -closed set are independent of each other. It is shown in the following example.

**Example: 3.11**

Let  $X = \{a, b, c, d\}$  and  $\tau = \{X, \Phi, \{a\}, \{b\}, \{a, b\}, \{b, c\}, \{a, b, c\}, \{a, b, d\}\}$ . In this topological space the subset  $A = \{a, d\}$  is  $\pi g$ -closed but not  $\pi g^*b^*$ -closed set and the subset  $B = \{a\}$  is  $\pi g^*b^*$ -closed but not  $\pi g$ -closed set.

The above discussions are summarized in the following diagram

(1)  $\pi g^*b^*$ -closed set, (2)  $g$ -closed set, (3)  $\pi$ -closed set, (4) closed set, (5)  $\alpha$ -closed set, (6) pre-closed set, (7)  $gb$ -closed set, (8)  $\pi g\alpha$ -closed set, (9)  $\pi gb$ -closed set, (10)  $\pi gs$ -closed set, (11)  $\pi gp$ -closed set, (12)  $\pi g$ -closed set.

**IV. CHARACTERISTICS OF  $\pi g^*b^*$ -CLOSED SETS**

**Remark 4.1**

Finite union of  $\pi g^*b^*$ -closed sets need not be  $\pi g^*b^*$ -closed which can be seen the following example.

**Example 4.1**

Let  $X = \{a, b, c\}$  with topology  $\tau = \{X, \Phi, \{a\}, \{b\}, \{a, b\}, \{a, c\}\}$ . Let  $A = \{a\}$  and  $B = \{b\}$  then both  $A$  and  $B$  are  $\pi g^*b^*$ -closed. But,  $A \cup B = \{a, b\}$  is not  $\pi g^*b^*$ -closed.

**Remark 4.2**

Finite intersection of  $\pi g^*b^*$ -closed sets need not be  $\pi g^*b^*$ -closed which can be seen the following example.

**Example 4.2**

Let  $X = \{a, b, c, d\}$  with topology  $\tau = \{X, \Phi, \{a\}, \{b\}, \{a, b\}, \{a, b, c\}, \{a, b, d\}\}$ . Let  $A = \{b, d\}$  and  $B = \{b, c, d\}$  then both  $A$  and  $B$  are  $\pi g^*b^*$ -closed. But,  $A \cap B = \{b, d\}$  is not  $\pi g^*b^*$ -closed.

**Theorem 4.1**

Let  $(X, \tau)$  be a topological space if  $A \subset X$  is  $\pi g^*b^*$ -closed set then  $int(bcl(A)) - A$  does not contain any non empty  $\pi g$ -closed set.

**Proof**

Let  $A$  be a  $\pi g^*b^*$ -closed set in  $(X, \tau)$  and  $F \subset int(bcl(A)) - A$  such that  $F$  is  $\pi g$ -closed in  $X$ . Then  $(X - F)$  is  $\pi g$ -open in  $X$  and  $A \subseteq (X - F)$ . since  $A$  is  $\pi g^*b^*$ -closed,  $int(bcl(A)) \subset (X - F) \Rightarrow F \subset (X - int(bcl(A)))$  therefore  $F \subset (int(bcl(A)) - A) \cap (X - int(bcl(A))) \Rightarrow F = \Phi$ . Therefore  $int(bcl(A)) - A$  does not contain any non empty  $\pi g$ -closed set.

**Theorem 4.2**

If  $A$  is a  $\pi g^*b^*$ -closed and  $B$  is any set such that  $A \subseteq B \subseteq int(bcl(A))$ , then  $B$  is a  $\pi g^*b^*$ -closed.

**Proof**

Let  $B \subseteq U$  and  $U$  be  $\pi g$ -open. since  $A \subseteq B \subseteq U$  and  $A$  is  $\pi g^*b^*$ -closed,  $int(bcl(A)) \subseteq U$ . Now  $int(bcl(B)) \subseteq int(bcl(A)) \subseteq U$ . Hence  $B$  is  $\pi g^*b^*$ -closed.

**Theorem 4.3**

Let  $(X, \tau)$  be a topological space if  $A \subset X$

**Definition: 4.1**

A set  $A \subset X$  is called  $\pi g^*b^*$ -open if and only if its complement is  $\pi g^*b^*$ -closed in  $X$ .

**Theorem 4.4**

A subset  $A \subset X$  is  $\pi g^*b^*$ -open if and only if  $F \subseteq \text{cl}(\text{bint}(A))$  whenever  $F$  is  $\pi g$ -closed and  $F \subseteq A$ .

**Proof**

Assume that  $A \subset X$  is  $\pi g^*b^*$ -open set in  $X$ . Let  $F$  be  $\pi g$ -closed such that  $F \subseteq A$ . Then  $(X-A) \subset (X-F)$ , since  $(X-A)$  is  $\pi g^*b^*$ -closed and  $(X-F)$  is  $\pi g$ -open,  $\text{int}(\text{bcl}(X-A)) \subseteq (X-F) \Rightarrow (X-\text{cl}(\text{bcl}(A))) \subseteq (X-F)$ . Hence  $F \subseteq \text{cl}(\text{bcl}(A))$ . Conversely, assume that  $F$  is  $\pi g$ -closed and  $F \subseteq A$  such that  $F \subseteq \text{cl}(\text{bcl}(A))$ . Let  $(X-A) \subseteq U$ , where  $U$  is  $\pi g$ -open. Then  $(X-U) \subseteq A$  and since  $(X-U) \subseteq \text{cl}(\text{bcl}(A)) \Rightarrow \text{int}(\text{bcl}(X-A)) \subseteq U$ . Hence  $(X-A)$  is  $\pi g^*b^*$ -closed and  $A$  is  $\pi g^*b^*$ -open.

**Theorem 4.5**

If  $\text{cl}(\text{bint}(A)) \subseteq B \subseteq A$  and  $A$  is  $\pi g^*b^*$ -open, then  $B$  is  $\pi g^*b^*$ -open.

**Proof**

Let  $F$  be a  $\pi g$ -closed set such that  $F \subseteq B$ . Since  $B \subseteq A$  we get  $F \subseteq A$ . Given  $A$  is  $\pi g^*b^*$ -open thus  $F \subseteq \text{cl}(\text{bint}(A)) \subseteq \text{cl}(\text{bint}(B))$ . Therefore  $B$  is  $\pi g^*b^*$ -open.

**Definition 4.2**

A space  $(X, \tau)$  is called a  $\pi g^*b^*T_{1/2}$  space if every  $\pi g^*b^*$ -closed set is  $b^*$ -closed.

**Theorem 4.6**

For a topological space  $(X, \tau)$  the following are equivalent

- 1)  $X$  is  $\pi g^*b^*T_{1/2}$
- 2)  $\forall$  subset  $A \subset X$ ,  $A$  is  $\pi g^*b^*$ -open if and only if  $A$  is  $b^*$ -open.

**Proof**

(1)  $\Rightarrow$  (2)

Let  $A \subset X$  be  $\pi g^*b^*$ -open. Then  $(X-A)$  is  $\pi g^*b^*$ -closed and by (1).  $(X-A)$  is  $b^*$ -closed  $\Rightarrow A$  is  $b^*$ -open. conversely assume  $A$  is  $b^*$ -open. Then  $(X-A)$  is  $b^*$ -closed. As every  $b^*$ -closed set is  $\pi g^*b^*$ -closed,  $(X-A)$  is  $\pi g^*b^*$ -closed  $\Rightarrow A$  is  $\pi g^*b^*$ -open. (2)  $\Rightarrow$  (1)

Let  $A$  be a  $\pi g^*b^*$ -closed set in  $X$ . Then  $(X-A)$  is  $\pi g^*b^*$ -open. Hence by (2)  $(X-A)$  is  $b^*$ -open  $\Rightarrow A$  is  $b^*$ -closed. Hence  $X$  is  $\pi g^*b^*T_{1/2}$ .

**Theorem 4.7**

Let  $(X, \tau)$  be a  $\pi g^*b^*T_{1/2}$  space then every singleton set is either  $\pi g$ -closed or  $b^*$ -open.

**Proof**

Let  $x \in X$  suppose  $\{x\}$  is not  $\pi g$ -closed. Then  $X - \{x\}$  is not  $\pi g$ -open. Hence  $X - \{x\}$  is trivially  $\pi g^*b^*$ -closed. Since  $X$  is  $\pi g^*b^*T_{1/2}$  space,  $X - \{x\}$  is  $b^*$ -closed  $\Rightarrow \{x\}$  is  $b^*$ -open.

**Definition 4.3**

The intersection of all  $\pi g^*b^*$ -closed set containing  $A$  is called the  $\pi g^*b^*$ -closure of  $A$  denoted by  $\pi g^*b^*\text{-cl}(A)$ .

**Theorem 4.8**

Let  $A \subset (X, \tau)$  and  $x \in X$ . Then  $x \in \pi g^*b^*\text{-cl}(A)$  if and only if  $V \cap A \neq \emptyset$  for every  $\pi g^*b^*$ -open set  $V$  containing  $x$ .

**Proof**

Suppose  $x \in \pi g^*b^*\text{-cl}(A)$  and let  $V$  be an  $\pi g^*b^*$ -open set such that  $x \in V$ . Assume  $V \cap A = \emptyset$ , then  $A \subset X/V \Rightarrow \pi g^*b^*\text{-cl}(A) \subset X/V \Rightarrow x \in X/V$ , a contradiction. Thus  $V \cap A \neq \emptyset$  for every  $\pi g^*b^*$ -open set  $V$  containing  $x$ . To prove the converse suppose  $x \notin \pi g^*b^*\text{-cl}(A) \Rightarrow x \in X / \pi g^*b^*\text{-cl}(A) = V$  (say). Then  $V$  is a  $\pi g^*b^*$ -open and  $x \in V$ . Also since  $A \subset \pi g^*b^*\text{-cl}(A) \Rightarrow A \not\subset V \Rightarrow V \cap A = \emptyset$ . Hence the theorem.

**Theorem 4.9**

For set  $A \subset (X, \tau)$  if  $A$  is  $\pi g$ -clopen then  $A$  is  $\pi g$ -open,  $Q$ -set,  $\pi g^*b^*$ -closed set.

**Proof**

Let  $A$  be  $\pi g$ -clopen. Then  $A$  is both  $\pi g$ -open and  $\pi g$ -closed. Hence  $A$  is both open and closed. Therefore,  $\text{cl}(\text{int}(A)) = \text{int}(\text{cl}(A))$ , thus  $A$  is a  $Q$ -set. As  $\text{bcl}(A) \subseteq \text{cl}(A) - A$ .  $\text{int}(\text{bcl}(A)) \subseteq \text{int}(A) = A$ .
