#### Abstract

An magic square is $\mathrm{N} * \mathrm{~N}$ matrix containing integers and addition result of each row, column and diagonally get the same value. The commonly used methods of constructing magic squares are the cross diagonals method for doubly even. But these method cannot be used to find higher order magic square. In this article we will find the method to solve higher order doubly even magic squares.

Keywords: Magic Square, Bhavya squares, 4nX4n Magic square, Doubly Even Magic Square

## I. INTRODUCTION

An $\mathrm{n} \times \mathrm{n}$ matrix A consisting of nonnegative integers is a general magic square of order n if the sum of elements in each row, column, and main diagonal is the same. The sum is the magic number. A general magic square $A$ of order $n$ is a magic square, denoted by $\operatorname{MS}(\mathrm{n})$, if the entries of A are distinct. A magic square A of order n is normal if the entries of $A$ are $n_{2}$ consecutive integers. Usually, the entry in position ( $i, j$ ) of a matrix $A$ is denoted by $a_{i, j}$.

Magic squares have been studied for 4000 years. The Loh-Shu magic square is the oldest known magic square; its invention is attributed to Fuh-Hic, the mythical founder of Chinese civilization [4]. A lot of work has been done on construction of magic squares; for more details, the interested reader may refer to [1,3-6,8,11], and the references therein.

The magic square are of three order:

1. Odd order magic square
2. Doubly even magic square : which are divisible by 4.
3. Singly even magic square : which are divisible by 2 .

## II. THEORUMS AND PROOFS

Lemma 1.1: if any 4 no. put in this formula then it will be the magic square of order $4 n x 4 n$ for $n \geq 1$ for all $n$ belongs to Positive integer.

A to $A_{1}$ are in arithmetic progression similarly, $A$ To $A_{2} / A_{3}$ in arithmetic progression and similarly, $B$ to $B_{1} / B_{2} / B_{3}, C$ to $C_{1} / C_{2} / C_{3}$ and $D$ to $D_{1} / D_{2} / D_{3}$. And $A_{1}$ is $n^{\text {th }}$ term.

Lemma 1.2 : For $\mathrm{n} \geq 1 \mathrm{~A}, \mathrm{~B}, \mathrm{C}, \mathrm{D}$ should follow these conditions:
(i) $\quad \mathrm{B}-\mathrm{A} \geq 5$
(ii) $\quad \mathrm{C}-\mathrm{B} \geq\left(4 \mathrm{X} \mathrm{n}^{2}+1\right)$
(iii) $\quad \mathrm{D}-\mathrm{C} \geq\left(\left(\mathrm{n}^{2}-1\right) \mathrm{X} 8+1\right)$
(iv) $\mathrm{A} \geq 4 \mathrm{n}^{2}-3+1$

From the formula we can put the values of $a_{i j}$ where $1 \leq i, j \leq 12$
$\mathrm{A}_{1}=\mathrm{A}-4 \mathrm{X}(\mathrm{n}-1)=\mathrm{A}-8$
$\mathrm{B}_{1}=\mathrm{B}+4 \mathrm{X}(\mathrm{n}-1)=\mathrm{B}+8$

Adding $1^{\text {st }}$ row
$\sum \mathrm{a}_{1 \mathrm{j}}=3(\mathrm{~A}+\mathrm{B}+\mathrm{C}+\mathrm{D})$ where $1 \leq \mathrm{j} \leq 12$
Similarly, adding $2^{\text {nd }}$ row
$\sum \mathrm{a}_{2 \mathrm{j}}=3(\mathrm{~A}+\mathrm{B}+\mathrm{C}+\mathrm{D})$ where $1 \leq \mathrm{j} \leq 12$
Similarly $3^{\text {rd }}$ to $12^{\text {th }}$ row
$\sum a_{3 j}=3(A+B+C+D)$ where $1 \leq j \leq 12$
$\sum a_{4 j}=3(A+B+C+D)$ where $1 \leq j \leq 12$
$\sum \mathrm{a}_{5 \mathrm{j}}=3(\mathrm{~A}+\mathrm{B}+\mathrm{C}+\mathrm{D})$ where $1 \leq \mathrm{j} \leq 12$
$\sum \mathrm{a}_{6 \mathrm{j}}=3(\mathrm{~A}+\mathrm{B}+\mathrm{C}+\mathrm{D})$ where $1 \leq \mathrm{j} \leq 12$
$\sum a_{7 j}=3(A+B+C+D)$ where $1 \leq j \leq 12$
$\sum \mathrm{a}_{8 \mathrm{j}}=3(\mathrm{~A}+\mathrm{B}+\mathrm{C}+\mathrm{D})$ where $1 \leq \mathrm{j} \leq 12$
$\sum \mathrm{a}_{9 \mathrm{j}}=3(\mathrm{~A}+\mathrm{B}+\mathrm{C}+\mathrm{D})$ where $1 \leq \mathrm{j} \leq 12$
$\sum \mathrm{a}_{10 \mathrm{j}}=3(\mathrm{~A}+\mathrm{B}+\mathrm{C}+\mathrm{D})$ where $1 \leq \mathrm{j} \leq 12$
$\sum \mathrm{a}_{11 \mathrm{j}}=3(\mathrm{~A}+\mathrm{B}+\mathrm{C}+\mathrm{D})$ where $1 \leq \mathrm{j} \leq 12$
$\sum \mathrm{a}_{12 \mathrm{j}}=3(\mathrm{~A}+\mathrm{B}+\mathrm{C}+\mathrm{D})$ where $1 \leq \mathrm{j} \leq 12$

So we can say ,
Rows are giving the same sum which we can call magic sum .
For it to become magic square columns and diagonals should have to give the same sum.
$1^{\text {st }}$ Column
$\sum \mathrm{a}_{\mathrm{i} 1}=3(\mathrm{~A}+\mathrm{B}+\mathrm{C}+\mathrm{D})$ where $1 \leq \mathrm{i} \leq 12$
Similarly other columns are also giving the same sum.
Diagonal
$\sum \mathrm{a}_{\mathrm{ii}}=3(\mathrm{~A}+\mathrm{B}+\mathrm{C}+\mathrm{D})$ where $1 \leq \mathrm{i} \leq 12$
So we can say the formula is giving the magic square of sum n times the sum of 4 X 4 square.

## Hence Proved

## Lemma 1.2 proof

(i) $\quad \mathrm{A} \geq 4 \mathrm{n}^{2}-3+1$ as $\mathrm{n}=3$
(ii) $\mathrm{B}-\mathrm{A} \geq 5$
(iii) $\mathrm{C}-\mathrm{B} \geq\left(4 \mathrm{X} \mathrm{n}^{2}+1\right)$
(iv) $\quad \mathrm{D}-\mathrm{C} \geq\left(\left(\mathrm{n}^{2}-1\right) \mathrm{X} 8+1\right)$
(i) As in this case consider term $\mathrm{a}_{1211}=\mathrm{A}-33$

Its minimum term for $A$ series $34=4 X 3^{2}-3+1$
(ii) It is clearly seen that maximum value of A series is $=\mathrm{A}+2$

And minimum value of B series is $=\mathrm{B}-2$
So minimum number of elements between $A$ and $B$ is 4 so minimum difference is 5 to distinguish all terms.
(iii) As in this case minimum of C series is $=\mathrm{C}-3$

And maximum value of $B$ series is $=B+33$
So minimum no. of elements between B and C is 36 so minimum difference is 37 which can be written as $=4 \mathrm{X} 3^{2}+1$
(iv) Minimum value of D series $=\mathrm{D}-32$

Maximum value of C series $=\mathrm{C}+32$
So minimum no. of elements between $D$ and $C$ is 64 so minimum difference is 65 which can be written as $=\left(3^{2}-1\right) \mathrm{X} 8+1$

| 26 | 47 | 84 | 133 | 14 | 59 | 96 | 121 | 2 | 71 | 108 | 109 |
| 136 | 81 | 46 | 27 | 124 | 93 | 58 | 15 | 112 | 105 | 70 | 3 |
| 45 | 28 | 135 | 82 | 57 | 16 | 123 | 94 | 69 | 4 | 111 | 106 |
| 83 | 134 | 25 | 48 | 95 | 122 | 13 | 60 | 107 | 110 | 1 | 72 |

And their Magic sum is $\mathbf{8 7 0}$.
Example 2: Consider $\mathrm{n}=2$
Solution: 8X8 magic square we have to make
$\mathrm{A}=4 \mathrm{n}^{2}-3+1=14$
$\mathrm{B}=\mathrm{A}+5=19$
$\mathrm{C}=\mathrm{B}+4 \mathrm{Xn}^{2}+1=36$
$\mathrm{D}=\mathrm{C}+\left(\left(\mathrm{n}^{2}-1\right) \mathrm{X} 8+1\right)=61$

| A | B | C | D | A-8 | B+8 | C+8 | D-8 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| D+3 | C-3 | B-1 | A+1 | D-5 | C+5 | B+7 | A-7 |
| B-2 | A+2 | D+2 | C-2 | B+6 | A-6 | D-6 | C+6 |
| C-1 | D+1 | A-1 | B+1 | C+7 | D-7 | A-9 | B+9 |
| A-4 | B+4 | C+4 | D-4 | A-12 | B+12 | C+12 | D-12 |
| D-1 | C+1 | B+3 | A-3 | D-9 | C+9 | B+11 | A-11 |
| B+2 | A-2 | D-2 | C+2 | B+10 | A-10 | D-10 | C+10 |
| C+3 | D-3 | A-5 | B+5 | C+11 | D-11 | A-13 | B+13 |

Putting the values of $A, B, C$ and $D$

| 14 | 19 | 36 | 61 | 6 | 27 | 44 | 53 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 64 | 33 | 18 | 15 | 56 | 41 | 26 | 7 |
| 17 | 16 | 63 | 34 | 25 | 8 | 55 | 42 |
| 35 | 62 | 13 | 20 | 43 | 54 | 5 | 28 |
| 10 | 23 | 40 | 57 | 2 | 31 | 48 | 49 |
| 60 | 37 | 22 | 11 | 52 | 45 | 30 | 3 |
| 21 | 12 | 59 | 38 | 29 | 4 | 51 | 46 |
| 39 | 58 | 9 | 24 | 47 | 50 | 1 | 32 |

Their magic sum is $\mathbf{2 6 0}$.
Remarks: All 4X4 magic square in the bigger square can be shuffled to make new magic square of same order . Previously there is no way to find these square but now we can solve these square with above method.

If $n$ is even it will always give even sum and if $n$ is odd it can give both odd and even sum. By selecting any 4X4 square which are used in the formation of bigger order square can change shuffle its positions with other square it will not affect the overall sum and new magic square can be made.

## ACKNOWLEDGEMENT

I would like to thanks Prof. A.k. Lal and Prof. S.S. Bhatia of Thapar University for their helpful discussions and suggestions.
