# Mass, FTIR, EPR and XRD Spectral Studies of the Complex of CuSO4 with Trithio Thiazyl Trichloride 

Dr. Veena Chauhan ${ }^{1}$, Dr. S.K.S. Chauhan ${ }^{2}$<br>Assistant Professor, Department of Chemistry, D. S. College, Aligarh, U. P. (India) ${ }^{1}$<br>Assistant Professor, Department of Chemistry, D. S. College, Aligarh, U. P. (India) ${ }^{2}$

#### Abstract

The trithioazyltrichloride was prepared, studied and used as a ligand (L) to prepare its complex with CuSO4. The complex was investigated with the help of Mass, FTIR, EPR and XRD diffraction spectra. The formulated complex $\left(\mathrm{S}_{3} \mathrm{~N}_{2} \mathrm{Cl}_{2} \mathrm{CuSO}_{4}\right)_{3}$ is found to be a quadridentated and paramagnetic with triclinic geometrical structure.

Keywords: Synthesis, Trithiothiazyltrichloride, copper sulphate, DMF.

## I. INTRODUCTION

$\mathrm{S}_{3} \mathrm{~N}_{3} \mathrm{Cl}_{3}{ }^{(1-3)}$ is a halogenated derivative of $\mathrm{S}_{4} \mathrm{~N}_{4}{ }^{(4)}$ has complexation tendency due to N and S donor atoms. Its complexes with $\mathrm{AlCl}_{3}{ }^{(5)}$ and $\mathrm{ThCl}_{4}{ }^{(6)}$ have been reported. The reaction of $\mathrm{S}_{3} \mathrm{~N}_{3} \mathrm{Cl}_{3}$ with Lewis acids like $\mathrm{SbCl}_{5}, \mathrm{SbF}_{5}, \mathrm{AsF}_{6}$ and $\mathrm{BCl}_{3}$ give ionic compounds ${ }^{(7)}$ of type $\mathrm{X}_{2} \mathrm{~N}_{3} \mathrm{~S}_{3}{ }^{+}(\mathrm{Cl})$. The transition metal complexes of type $\mathrm{N}\left(\mathrm{SCl}_{2} \mathrm{M}^{+} \mathrm{X}^{-}\right.$have also reported by Alange ${ }^{(8)}$ et.al. $\mathrm{S}_{3} \mathrm{~N}_{3} \mathrm{Cl}_{3}$ react with $\mathrm{Mo}(\mathrm{CO})_{6}$ give $\mathrm{MoS}_{3} \mathrm{~N}_{3} \mathrm{Cl}_{3}$ was studied by Kineth ${ }^{(9)}$. The spectra investigation of the complex $\left(\mathrm{S}_{3} \mathrm{~N}_{2} \mathrm{Cl}_{2} \mathrm{CuSO}_{4}\right)_{3}$ from the reaction of $\mathrm{S}_{3} \mathrm{~N}_{3} \mathrm{Cl}_{3}$ with $\mathrm{CuSO}_{4}$ is reported here in.

## II. EXPERIMENTAL

$\mathrm{S}_{4} \mathrm{~N}_{4}$, starting material in this work was prepared by passing dry $\mathrm{NH}_{3}$ gas in $\mathrm{S}_{2} \mathrm{Cl}_{2}$ in $\mathrm{CCl}_{4} . \mathrm{S}_{3} \mathrm{~N}_{3} \mathrm{Cl}_{3}$ was synthesized by passing dry $\mathrm{Cl}_{2}$ gas in the solution of $\mathrm{S}_{4} \mathrm{~N} 4$ in $\mathrm{CS}_{2}$ at $0^{\circ} \mathrm{c}$. $\left(\mathrm{S}_{3} \mathrm{~N}_{2} \mathrm{Cl}_{2} \mathrm{CuSO}_{4}\right)_{3}$ was prepared by refluxing equimolar ratio of $\mathrm{S}_{3} \mathrm{~N}_{3} \mathrm{Cl}_{3}$ with $\mathrm{CuSO}_{4}$ in DMF. The brackish colored product was separated by filtration and washed with DMF, alcohol ether and stored in vacuum desiccator for different analysis. The quantitative estimation of complex was done by standards methods as well as by mass spectrometry which was carried out on mass spectrometer model no. 7070F, using E.I. operations at $0^{\circ} \mathrm{K}$.The molecular weight of the complex was determined by Rast's method using camphor as solvent. The electronic spectrum was recorded on Varian VIS 2390, spectrophotometer. FTIR and EPR spectra of the complex were recorded on Nicolet FTIR and X-E, 4 band EPR (at LNT) spectrophotometer respectively. XRD spectrum of the complex was recorded on XRD -6 SPG-3 single chasis model 11GM 11 diffractometer by using Fe $\mathrm{K}_{\alpha}$ as source of radiations of the wavelength $1.948 \mathrm{~A}^{0}$ at $50 \mathrm{kvp} / 10 \mathrm{Mo}$ by plate dispersion method.

## III. RESULT AND DISCUSSION

The complex of $\mathrm{S}_{3} \mathrm{~N}_{3} \mathrm{Cl}_{3}$ with $\mathrm{CuSO}_{4}$ is insoluble in most of the solvents and do not melt up to $400^{0}$. Its analytical data, found $\% \mathrm{~S}=36.11, \mathrm{~N}=7.89, \mathrm{Cl}=20.00, \mathrm{Cu}=17.98$. $(\mathrm{Cal}) \% \mathrm{~S}=36.10, \mathrm{~N}=7.50, \mathrm{Cl}=20.03, \mathrm{Cu}=18.05$ and molecular weight, $1066.30(\mathrm{cal}=1063.50) \mathrm{g} / \mathrm{mole}$ are good agreement with the suggested molecular formula $\left(\mathrm{S}_{3} \mathrm{~N}_{2} \mathrm{Cl}_{2} . \mathrm{CuSO}_{4}\right)_{3}$.
Mass spectral studies of the complex show peaks due to $(57 \mathrm{M} / \mathrm{e}) \mathrm{N}_{4}^{+}$, $(64 \mathrm{M} / \mathrm{e}) \mathrm{Cu}^{++},(69 \mathrm{M} / \mathrm{e}) \mathrm{S}^{+}-\mathrm{Cl}, \quad(78 \mathrm{M} / \mathrm{e}) \mathrm{Cu}^{+} \mathrm{N}$, ( $80 \mathrm{M} / \mathrm{e}$ ) CuO , ( $97 \mathrm{M} / \mathrm{e}$ ) CuS , ( $83 \mathrm{M} / \mathrm{e}$ ) $\mathrm{N}=\mathrm{S}^{+}-\mathrm{Cl}$, ( $97 \mathrm{M} / \mathrm{e}$ ) $\mathrm{Cu}^{+} \mathrm{S}$, ( $105 \mathrm{M} / \mathrm{e}$ ) $\mathrm{S}_{2}{ }^{+} \mathrm{N}_{3}$, ( $129 \mathrm{M} / \mathrm{e}$ ) $\mathrm{S}_{2}{ }^{+} \mathrm{N}_{2} \mathrm{Cl},(149 \mathrm{M} / \mathrm{e})$ $\mathrm{N}^{+} \mathrm{S}_{2} \mathrm{Cl}_{2}, 257 \mathrm{Cl} \mathrm{S}_{3} \mathrm{~N}_{2} \mathrm{Cu}^{++}$cation along with sulphate ion as an unit of its molecular formula ( $\mathrm{S}_{3} \mathrm{~N}_{2} \mathrm{Cl}_{2} \mathrm{Cu}^{++} \mathrm{SO}_{4}{ }^{--}$).
The two bands are present in the electronic spectrum of the complex. The band at 200 nm is shown charge transfer transition between $\mathrm{Cu}^{++}$and $\mathrm{SO}_{4}{ }^{--}$ions, which is also indicated by mass spectrum. The charge transfer transition is also confirmed by frequency ratio $\mathrm{v} / \mathrm{v} \quad 0.80<=1$, the band at 320 nm shows $\mathrm{p} \pi-\mathrm{d} \pi$ transitions of the ligand $\mathrm{S}_{3} \mathrm{~N}_{2} \mathrm{Cl}_{2}$. The band for ${ }^{2} \mathrm{~T}_{\mathrm{g}}{ }_{-}{ }^{2} \mathrm{Eg}$ transition of $\mathrm{Cu}{ }^{++}$is not appear in the spectrum suggest that $\mathrm{CuSO}_{4}$ co-ordinated to $\mathrm{S}_{3} \mathrm{~N}_{2} \mathrm{Cl}_{2}$ in the complex. The co-ordination is also supported by the values of oscillator strength $. f,=3.1 \times 10^{-4}$ for the spin allowed laporte forbidden transitions ,confirming exchange of electron pairs to $\mathrm{Cu}^{++}$with the formation of the complex. The value of Eg $=5.166 \mathrm{ev}$ and its conductivity $\lambda_{\infty}=1.33 \times 10^{24}$ (mhos) indicate that it is good conductor

In FTIR spectrum the presence of fragment are also confined by the bands at 426.14 (S), 461.52, 479 (V), 479 and 620 $\mathrm{cm}^{-1}$ are due to coordinated N-S-M , S-O-M and $\mathrm{SO}_{4}{ }^{-2}$ ions. The free S-N bands appear at $620,638,673,744,797,833$,

# International Advanced Research Journal in Science, Engineering and Technology 

Vol. 8, Issue 6, June 2021
DOI: 10.17148/IARJSET.2021.8608
$868,974 \mathrm{~cm}^{-1}$. The bands at $698 \mathrm{~cm}^{-1}$ for $\mathrm{S}-\mathrm{N}, 1322 \mathrm{~cm}^{-1}$ and $1014 \mathrm{~cm}^{-1}$ for $\mathrm{N}-\mathrm{S}-\mathrm{Cl}$ or trimer $(\mathrm{N}-\mathrm{S}-\mathrm{Cl})_{3}$ are consistent with those reported. The symmetric bands at $1116,1151 \mathrm{~cm}^{-1}$ are due to $\mathrm{N}-\mathrm{S}-\mathrm{Cl}$ or $\mathrm{Cl}-\mathrm{S}-\mathrm{N}$ linkage to $\mathrm{Cu}^{++}$ions. The shifting of frequencies infers the change in $\mathrm{S}_{3} \mathrm{~N}_{3} \mathrm{Cl}$ ring and its linkage to $\mathrm{CuSO}_{4}$. The calculated value of force constant from the equation $v=5.3 \times 10^{-12} \sqrt{ }(\mathrm{k} / \mu)$ subsequently in order $1.6 \times 10^{5}$ and $6.12 \times 10^{-5}$ dyne $/ \mathrm{cm}^{2}$ show the presence of single S-N and double $\mathrm{S}=\mathrm{N}$ bond in $\mathrm{S}_{3} \mathrm{~N}_{2} \mathrm{Cl}_{2}$ ring. While the higher value of force constant ( $\mathrm{K}=59$ or $70 \times 10^{5}$ dyne $/ \mathrm{cm}^{2}$ ) confirms the coordination of $\mathrm{S}_{3} \mathrm{~N}_{3} \mathrm{Cl}$ ring with $\mathrm{CuSO}_{4}$. FTIR spectrum of the complex has supported the $\mathrm{Cu}^{++}$, bridged coordination of $\mathrm{CuSO}_{4}$ with $\mathrm{S}_{3} \mathrm{~N}_{3} \mathrm{Cl}$. Above points of FTIR and mass spectra are confirmed that $\mathrm{S}_{3} \mathrm{~N}_{3} \mathrm{Cl}_{3}$ cyclic ring contraction take place during the course of reaction of the $\mathrm{S}_{3} \mathrm{~N}_{3} \mathrm{Cl}$ with $\mathrm{CuSo}_{4}$ shown below-:

$$
3 \mathrm{~S}_{3} \mathrm{~N}_{3} \mathrm{Cl}_{3}+3 \mathrm{CuSO}_{4} \longrightarrow\left(\mathrm{~S}_{3} \mathrm{~N}_{2} \mathrm{Cl}_{2} \mathrm{CuSO}_{4}\right)_{3}+\mathrm{NCl}_{3}+\mathrm{N}_{2}
$$

The EPR spectrum of complex is shown three prominent signals at 5650,6275 and 6925 gauss. The signals at 5650 and 6925 G are broad indicating the presence of charge transfer transition between $\mathrm{Cu}^{++} \mathrm{SO}_{4}{ }^{--}$and d ${ }^{9}$ electronic configuration of $\mathrm{Cu}^{++}$ion which can take electron pairs to form coordinated complex. The value of $\mu_{\text {eff }}$ and magnetic susceptibility $\chi_{\mathrm{A}}$ found as $\chi_{A}=1 / \mathrm{T}\left(\mu_{\text {eff }} / 2.828\right)^{2}$. The EPR spectral data in table-2 are also confirming to $\mathrm{d}^{9}$ electronic configuration of $\mathrm{Cu}^{++}$with the presence of single unpaired electron and its paramagnetic. The sharp and narrow high intensity peak 6275 G in the EPR spectrum indicating that exchange of electron pairs has occurred in the complex $\left(\mathrm{S}_{3} \mathrm{~N}_{3} \mathrm{Cl}_{2} \mathrm{CuSO}_{4}\right)_{3}$ between $\mathrm{CuSO}_{4}$ and $\mathrm{S}_{3} \mathrm{~N}_{3} \mathrm{Cl}$ ligand. The proposed structure of the complex is given in Fig-1.

Fig -1 Proposed structure of the complex $\left(\mathrm{S}_{3} \mathrm{~N}_{2} \mathrm{Cl}_{2} \mathrm{CuSO}_{4}\right)_{3}$
XRD spectrum of the complex was recorded in $2 \theta$ range of $3^{\circ}$ to $40^{\circ}$. The value of $\mathrm{d}, \operatorname{Sin}^{2} \theta$, miller indices and intensity ratio was calculated (Table-3). The high Value of intensity ratio indicate that complex is more than $50 \%$ crystalline in nature. From the values of $\operatorname{Sin}^{2} \Theta$ and d, the axial distance and axial angles were determined. The found values are given as below $\mathrm{a}_{\mathrm{o}}=3.54 \mathrm{~A}^{\circ}, \mathrm{b}_{\mathrm{o}}=5.008 \mathrm{~A}^{\mathrm{o}}, \mathrm{c}_{\mathrm{o}}=4.085 \mathrm{~A}^{\circ}, \alpha=35.29^{\circ}, \beta=54.78^{\circ}$ and $\gamma=45^{\circ}$. This data suggest that atoms of the complex are arranged in triclinic geometrical pattern with polymeric chain.
