ABSTRACT: In this article, an implicit one-step third derivative hybrid block method was developed for the numerical solution of first order initial value problems in ordinary differential Equations. In developing the method, interpolation and collocation techniques were considered for developing hybrid block methods. In developing the method we employed the conventional Taylor series expansion. To further justify the usability of the proposed method, the basic properties which infer convergence when adopted to solve ordinary differential equations were investigated. The proposed method validates its superiority over existing methods as seen in the accuracy of our results from the numerical examples. Furthermore, we called this formula OCB12 method

Keywords: Hybrid Block Method, First Order, Initial Value Problems, Taylor Series, Collocation, Interpolation, Third derivative.

1. INTRODUCTION

In this article, we proposed an implicit one-step third derivative hybrid block method for solving first order initial value problems in ordinary differential equations of the form

$$y' = f(x, y), \quad y(x_0) = y_0, \quad a \leq x \leq b \quad (1)$$

where x_0 is the initial point, y_0 is the solution at the initial point and f is assumed to satisfy Lipchitz condition as stated below without proof.

Theorem 1[1]: let $f(x, y)$ be defined and continuous for all points (x, y) in the region D defined by $a \leq x \leq b, -\infty < y < \infty$, a and b finite, and let there exist a constant L such that, for every, x, y, y^* , (x, y) and (x, y^*) are both in D ;

$$|f(x, y) - f(x, y^*)| \leq L|y - y^*| \quad (2)$$

Then, if y_0 is any given number, there exist a unique solution $y(x)$ of the initial value problem (1), where $y(x)$ is continuous and differentiable for all (x, y) in D . According to [2], equation (1) is used to model problems involving trajectory of a ballistic missile, the motion of an artificial satellite in its orbit, theories concerning electrical networking, bending of beams, stability of aircraft and many others. Most often, these problems do not have analytical solutions; hence appropriate numerical methods are adopted to solve such problems [1]. Some approaches to numerical method

include the Runge Kutta type, (self-starting), the linear multistep methods, particularly the implicit methods, and many others [3]. Conventionally, implicit linear multistep methods are implemented in the predictor-corrector mode which is prone to error propagation as the integration process progresses. The disadvantages associated with the predictor-corrector method led to the development of block methods from linear multistep method. Block methods which are used by many scholars for solving problem (1), were first introduced by [4] and later by [5] mainly to provide starting values for predictor-corrector algorithms. Those methods produced better accuracy than the usual step by step methods. [6], on the other hand, extended Milne's idea to develop block methods for solving ODEs. In order to obtain higher order methods and increase the accuracy of the approximate solution, [7] proposed hybrid block methods which included off-step point(s) in the derivation of the algorithms. Furthermore, hybrid block methods were used to circumvent Dahlquists barrier conditions, which stipulate that the order of a k-step Linear Multistep Method (LMM) cannot exceed $k + 1$ when k is odd or $k + 2$ when k is even for the method to be zero-stable. In addition, hybrid block methods are also known to share with Runge-Kutta methods their favorable advantage of being self starting and more accurate since they are implemented as a block. In hybrid block methods, step and off-step points are combined to form a single block for solving ODEs. In addition, [10] proposed, one and two-step new hybrid methods for the numerical solution of first order initial value problems, [8] proposed, Optimization of one step block method with three hybrid points for solving first-order ordinary differential equations, [9] proposed Extended One-Step Block Method for Solving Stiff equations to enhance the accuracy of the approximation of initial value problems. The main idea of this study is to improve on the work of [8,9, 10] by developing an implicit one-step third derivative hybrid block method for numerical solution of first order initial value problems in ordinary differential equations with high accuracy.

2. DEVELOPMENT OF OCB12 METHOD.

This section shows the development of the implicit one-step third derivative hybrid block method for solving initial value problems. The scheme for the hybrid block method is developed from the Obrechkoff method given as:

$$y_{n+k} = \sum_{j=0}^{k-1} \alpha_j y_{n+j} + \sum_{i=1}^l h^i \sum_{i=0}^k (\varphi_{\eta i} f_{n+i} + \varphi_{\eta i} g_{n+i} + \varphi_{\eta i} p_{n+i}), \eta = 1, 2, 3, k = 1, l = 3 \quad (3)$$

In order to obtain the main method for one-step, we rewrite equation (3) to be:

$$\begin{aligned} y_{n+1} = & \alpha_0 y_n + h \left(\varphi_{10} y_n + \varphi_{1\frac{1}{3}} y_{n+\frac{1}{3}} + \varphi_{1\frac{2}{3}} y_{n+\frac{2}{3}} + \varphi_{11} y_{n+1} \right) + h^2 \left(\varphi_{20} y_n + \varphi_{2\frac{1}{3}} y_{n+\frac{1}{3}} + \varphi_{2\frac{2}{3}} y_{n+\frac{2}{3}} + \varphi_{21} y_{n+1} \right) \\ & + h^3 \left(\varphi_{30} y_n + \varphi_{3\frac{1}{3}} y_{n+\frac{1}{3}} + \varphi_{3\frac{2}{3}} y_{n+\frac{2}{3}} + \varphi_{31} y_{n+1} \right) \end{aligned} \quad (4)$$

Using Taylor series expansion to expand individual terms in (4) and upon substitution of the expansions back in (4), the matrix form $Ax = B$ obtained from the expression:

$y_{n+a} = y(x_n + ah) = y(x_n) + ah y'(x_n) + \frac{(ah)^2}{2!} y''(x_n) + \frac{(ah)^3}{3!} y'''(x_n) + \dots$ and the coefficients of $y^{(m)}(x_n)$ are equated to be:

$$\left[\begin{array}{cccccccccccc} h & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ h & h & h & h & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & \frac{1}{3}h & \frac{2}{3}h & h & h & h & h & h & 0 & 0 & 0 & 0 & 0 \\ 0 & \frac{\left(\frac{1}{3}h\right)^2}{2!} & \frac{\left(\frac{2}{3}h\right)^2}{2!} & \frac{1}{2!}h & 0 & \frac{1}{3}h & \frac{2}{3}h & h & h & h & h & h & h \\ 0 & \frac{\left(\frac{1}{3}h\right)^3}{3!} & \frac{\left(\frac{2}{3}h\right)^3}{3!} & \frac{1}{3!} & 0 & \frac{\left(\frac{1}{3}h\right)^2}{2!} & \frac{\left(\frac{2}{3}h\right)^2}{2!} & \frac{1}{2!} & 0 & \frac{1}{3} & \frac{2}{3} & h & \\ 0 & \frac{\left(\frac{1}{3}h\right)^4}{4!} & \frac{\left(\frac{2}{3}h\right)^4}{4!} & \frac{1}{4!} & 0 & \frac{\left(\frac{1}{3}h\right)^3}{3!} & \frac{\left(\frac{2}{3}h\right)^3}{3!} & \frac{1}{3!} & 0 & \frac{\left(\frac{1}{3}h\right)^2}{2!} & \frac{\left(\frac{2}{3}h\right)^2}{2!} & \frac{1}{2!} & \\ 0 & \frac{\left(\frac{1}{3}h\right)^5}{5!} & \frac{\left(\frac{2}{3}h\right)^5}{5!} & \frac{1}{5!} & 0 & \frac{\left(\frac{1}{3}h\right)^4}{4!} & \frac{\left(\frac{2}{3}h\right)^4}{4!} & \frac{1}{4!} & 0 & \frac{\left(\frac{1}{3}h\right)^3}{3!} & \frac{\left(\frac{2}{3}h\right)^3}{2!} & \frac{1}{3!} & \\ 0 & \frac{\left(\frac{1}{3}h\right)^6}{6!} & \frac{\left(\frac{2}{3}h\right)^6}{6!} & \frac{1}{6!} & 0 & \frac{\left(\frac{1}{3}h\right)^5}{5!} & \frac{\left(\frac{2}{3}h\right)^5}{5!} & \frac{1}{5!} & 0 & \frac{\left(\frac{1}{3}h\right)^4}{4!} & \frac{\left(\frac{2}{3}h\right)^4}{4!} & \frac{1}{4!} & \\ 0 & \frac{\left(\frac{1}{3}h\right)^7}{7!} & \frac{\left(\frac{2}{3}h\right)^7}{7!} & \frac{1}{7!} & 0 & \frac{\left(\frac{1}{3}h\right)^6}{6!} & \frac{\left(\frac{2}{3}h\right)^6}{6!} & \frac{1}{6!} & 0 & \frac{\left(\frac{1}{3}h\right)^5}{5!} & \frac{\left(\frac{2}{3}h\right)^5}{5!} & \frac{1}{5!} & \\ 0 & \frac{\left(\frac{1}{3}h\right)^8}{8!} & \frac{\left(\frac{2}{3}h\right)^8}{8!} & \frac{1}{8!} & 0 & \frac{\left(\frac{1}{3}h\right)^7}{7!} & \frac{\left(\frac{2}{3}h\right)^7}{7!} & \frac{1}{7!} & 0 & \frac{\left(\frac{1}{3}h\right)^6}{6!} & \frac{\left(\frac{2}{3}h\right)^6}{6!} & \frac{1}{6!} & \\ 0 & \frac{\left(\frac{1}{3}h\right)^9}{9!} & \frac{\left(\frac{2}{3}h\right)^9}{9!} & \frac{1}{9!} & 0 & \frac{\left(\frac{1}{3}h\right)^8}{8!} & \frac{\left(\frac{2}{3}h\right)^8}{8!} & \frac{1}{8!} & 0 & \frac{\left(\frac{1}{3}h\right)^7}{7!} & \frac{\left(\frac{2}{3}h\right)^7}{7!} & \frac{1}{7!} & \\ 0 & \frac{\left(\frac{1}{3}h\right)^{10}}{10!} & \frac{\left(\frac{2}{3}h\right)^{10}}{10!} & \frac{1}{10!} & 0 & \frac{\left(\frac{1}{3}h\right)^9}{9!} & \frac{\left(\frac{2}{3}h\right)^9}{9!} & \frac{1}{9!} & 0 & \frac{\left(\frac{1}{3}h\right)^8}{8!} & \frac{\left(\frac{2}{3}h\right)^8}{8!} & \frac{1}{8!} & \\ 0 & \frac{\left(\frac{1}{3}h\right)^{11}}{11!} & \frac{\left(\frac{2}{3}h\right)^{11}}{11!} & \frac{1}{11!} & 0 & \frac{\left(\frac{1}{3}h\right)^{10}}{10!} & \frac{\left(\frac{2}{3}h\right)^{10}}{10!} & \frac{1}{10!} & 0 & \frac{\left(\frac{1}{3}h\right)^9}{9!} & \frac{\left(\frac{2}{3}h\right)^9}{9!} & \frac{1}{9!} \end{array} \right] = \begin{bmatrix} \alpha_0 \\ \varphi_{10} \\ \varphi_{\frac{1}{3}} \\ \varphi_{\frac{1}{3}} \\ \varphi_{12} \\ \varphi_{20} \\ \varphi_{\frac{2}{3}} \\ \varphi_{\frac{2}{3}} \\ \varphi_{21} \\ \varphi_{30} \\ \varphi_{\frac{3}{3}} \\ \varphi_{\frac{3}{3}} \\ \varphi_{31} \end{bmatrix} = \begin{bmatrix} \frac{1}{2!} \\ \frac{1}{3!} \\ \frac{1}{4!} \\ \frac{1}{5!} \\ \frac{1}{6!} \\ \frac{1}{7!} \\ \frac{1}{8!} \\ \frac{1}{9!} \\ \frac{1}{10!} \\ \frac{1}{11!} \\ \frac{1}{12!} \\ \frac{1}{13!} \end{bmatrix}$$

(5)

Solving equation (5) we obtained the values of $\left[\alpha_0, \varphi_{10}, \varphi_{\frac{1}{3}}, \varphi_{\frac{1}{3}}, \varphi_{12}, \varphi_{20}, \varphi_{\frac{2}{3}}, \varphi_{\frac{2}{3}}, \varphi_{21}, \varphi_{30}, \varphi_{\frac{3}{3}}, \varphi_{\frac{3}{3}}, \varphi_{31} \right]^T$ as:

$$\left[1, \frac{1283}{9856}, \frac{3645}{9856}, \frac{3645}{9856}, \frac{1283}{9856}, \frac{311}{49280}, -\frac{243}{49280}, \frac{243}{49280}, -\frac{311}{49280}, \frac{17}{147840}, \frac{81}{49280}, \frac{81}{49280}, \frac{17}{147840} \right]^T$$

substituting into equation (4) we have:

$$\begin{aligned} y_{n+1} = & y_n + \frac{1283}{9856}hf_n + \frac{3645}{9856}f_{n+\frac{1}{3}} + \frac{3645}{9856}hf_{n+\frac{2}{3}} + \frac{1283}{9856}f_{n+1} + \frac{311}{49280}h^2g_n - \frac{243}{49280}h^2g_{n+\frac{1}{3}} + \frac{243}{49280}h^2g_{n+\frac{2}{3}} \\ & - \frac{311}{49280}h^2g_{n+1} + \frac{17}{147840}h^3p_n + \frac{81}{49280}h^3p_{n+\frac{1}{3}} + \frac{81}{49280}h^3p_{n+\frac{2}{3}} + \frac{17}{147840}h^3p_{n+1} \end{aligned} \quad (6)$$

To implement OCB12 method derived in Equation (6), an additional method is needed. This method is obtain by similar approach to have the following:

$$\begin{aligned} y_{n+\frac{1}{3}} &= y_n + \frac{912523}{7185024} hf_n + \frac{23717}{88704} hf_{n+\frac{1}{3}} - \frac{5851}{88704} hf_{n+\frac{2}{3}} + \frac{35339}{7185024} hf_{n+1} + \frac{214943}{35925120} h^2 g_n - \frac{10657}{1330560} h^2 g_{n+\frac{1}{3}} \\ &+ \frac{10657}{1330560} h^2 g_{n+\frac{2}{3}} - \frac{5941}{11975040} h^2 g_{n+1} + \frac{11369}{107775360} h^3 p_n + \frac{4423}{2395008} h^3 p_{n+\frac{1}{3}} - \frac{7453}{11975040} h^3 p_{n+\frac{2}{3}} + \frac{1513}{107775360} h^3 p_{n+1} \end{aligned} \quad (7)$$

$$\begin{aligned} y_{n+\frac{2}{3}} &= y_n + \frac{7031}{56133} hf_n + \frac{302}{693} f_{n+\frac{1}{3}} + \frac{71}{693} hf_{n+\frac{2}{3}} + \frac{178}{56133} f_{n+1} + \frac{544}{93555} h^2 g_n + \frac{32}{10395} h^2 g_{n+\frac{1}{3}} \\ &- \frac{32}{10395} h^2 g_{n+\frac{2}{3}} - \frac{92}{280665} h^2 g_{n+1} + \frac{17}{168399} h^3 p_n + \frac{212}{93555} h^3 p_{n+\frac{1}{3}} - \frac{19}{93555} h^3 p_{n+\frac{2}{3}} + \frac{8}{841995} h^3 p_{n+1} \end{aligned} \quad (8)$$

Hence, equation (6), (7) and (8) are the required block method for the solution of equation (1)

3.0 Analysis of OCB12 method

3.1 Order of OCB12 method

We define a linear operator L by:

$$L[y(x):h] = \sum_{j=0}^k [\alpha_j y(x_n + jh) - h\varphi_j y'(x_n + jh)] \quad (9)$$

Where $y(x)$ is an arbitrary test function that is continuously differentiable in the interval $[a, b]$. Expanding

$y(x_n + jh)$ and $y'(x_n + jh)$ by Taylor's series about the point x_n and collecting like terms in h and y we obtain:

$$L[y(x):h] = C_0 y(x) + C_1 h y'(x) + C_2 h^2 y''(x) + \dots + C_p h^p y^p(x) \quad (10)$$

Definition 3.1

According to [11], the differential equation (9) and the associated Linear Multistep Method are said to be of order p if

$$C_0 = C_1 = C_2 = \dots = C_p = 0, C_{p+1} \neq 0 \quad (11)$$

Definition 3.2

The term C_{p+1} is called error constant and it implies that the local truncation error is given by

$$E_{p+1} = C_{p+1} h^{p+1} y^{(p+1)}(x_n) + O(h^{p+2}) \quad (12)$$

Following Definition 3.1 and 3.2. The order of the block method in equation (6), (7) and (8) is gotten by:

$$C_0 = \begin{pmatrix} 1-1 \\ 1-1 \\ 1-1 \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix}$$

$$C_1 = \begin{pmatrix} 1 - \left[\frac{1283}{9856} + \frac{3645}{9856} + \frac{3645}{9856} + \frac{1283}{9856} \right] \\ \frac{1}{3} - \left[\frac{912523}{7185024} + \frac{23717}{88704} - \frac{5851}{88704} + \frac{35339}{7185024} \right] \\ \frac{2}{3} - \left[\frac{7031}{56133} + \frac{302}{693} + \frac{71}{693} + \frac{178}{56133} \right] \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix}$$

$$C_2 = \begin{pmatrix} \frac{1}{2!} - \left[(0) \frac{1283}{9856} + \left(\frac{1}{3} \right) \frac{3645}{9856} + \left(\frac{2}{3} \right) \frac{3645}{9856} + \frac{1283}{9856} + \frac{311}{49280} - \frac{243}{49280} + \frac{243}{49280} - \frac{311}{49280} \right] \\ \frac{\left(\frac{1}{3} \right)^2}{2!} - \left[(0) \frac{912525}{7185024} + \left(\frac{1}{3} \right) \frac{23717}{88704} - \left(\frac{2}{3} \right) \frac{5851}{88704} + \frac{35339}{7185024} + \frac{214943}{35925120} - \frac{10657}{1330560} + \frac{10657}{1330560} - \frac{5941}{11975040} \right] \\ \frac{\left(\frac{2}{3} \right)^2}{2!} - \left[(0) \frac{7031}{56133} + \left(\frac{1}{3} \right) \frac{302}{693} + \left(\frac{2}{3} \right) \frac{71}{693} + \frac{178}{56133} + \frac{544}{93555} + \frac{32}{10395} - \frac{32}{10395} - \frac{92}{280665} \right] \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix}$$

$$C_3 = \begin{pmatrix} \frac{1}{3!} - \left[(0) \frac{1283}{9856} + \frac{\left(\frac{1}{3} \right)^2}{2!} \frac{3645}{9856} + \frac{\left(\frac{2}{3} \right)^2}{2!} \frac{3645}{9856} + \frac{1}{2!} \left(\frac{1283}{9856} \right) + (0) \frac{311}{49280} - \left(\frac{1}{3} \right) \frac{243}{49280} + \left(\frac{2}{3} \right) \frac{243}{49280} - \frac{311}{49280} + \frac{17}{147840} + \frac{81}{49280} + \frac{81}{49280} + \frac{17}{147840} \right] \\ \frac{\left(\frac{1}{3} \right)^3}{3!} - \left[(0) \frac{912525}{7185024} + \frac{\left(\frac{1}{3} \right)^2}{2!} \frac{23717}{88704} - \frac{\left(\frac{2}{3} \right)^2}{2!} \frac{5851}{88704} + \frac{1}{2!} \left(\frac{35339}{7185024} \right) + (0) \frac{214943}{35925120} - \left(\frac{1}{3} \right) \frac{10657}{1330560} + \left(\frac{2}{3} \right) \frac{10657}{1330560} - \frac{5941}{11975040} + \frac{11369}{107775360} + \frac{4423}{2395008} - \frac{7453}{11975040} + \frac{1513}{107775360} \right] \\ \frac{\left(\frac{2}{3} \right)^3}{3!} - \left[(0) \frac{7031}{56133} + \frac{\left(\frac{1}{3} \right)^2}{2!} \frac{302}{693} - \frac{\left(\frac{2}{3} \right)^2}{2!} \frac{71}{693} + \frac{1}{2!} \left(\frac{178}{56133} \right) + (0) \frac{544}{93555} + \left(\frac{1}{3} \right) \frac{32}{10395} - \left(\frac{2}{3} \right) \frac{32}{10395} - \frac{92}{280665} + \frac{17}{168399} + \frac{212}{93555} - \frac{19}{93555} + \frac{8}{841995} \right] \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix}$$

$$C_4 = \left[\begin{array}{l} \frac{1}{4!} - \left[\begin{array}{l} (0) \frac{1283}{9856} + \frac{\left(\frac{1}{3}\right)^3}{3!} \frac{3645}{9856} + \frac{\left(\frac{2}{3}\right)^3}{3!} \frac{3645}{9856} + \frac{1}{3!} \left(\frac{1283}{9856} \right) + (0) \frac{311}{49280} \\ - \frac{\left(\frac{1}{3}\right)^2}{2!} \frac{243}{49280} + \frac{\left(\frac{2}{3}\right)^2}{2!} \frac{243}{49280} - \frac{1}{2!} \frac{311}{49280} + (0) \frac{17}{147840} + \frac{1}{3} \frac{81}{49280} \\ + \frac{2}{3} \frac{81}{49280} + \frac{17}{147840} \end{array} \right] \\ \left(\frac{1}{3} \right)^4 - \left[\begin{array}{l} (0) \frac{912525}{7185024} + \frac{\left(\frac{1}{3}\right)^3}{3!} \frac{23717}{88704} - \frac{\left(\frac{2}{3}\right)^3}{3!} \frac{5851}{88704} + \\ \frac{1}{3!} \left(\frac{35339}{7185024} \right) + (0) \frac{214943}{35925120} - \frac{\left(\frac{1}{3}\right)^2}{2!} \frac{10657}{1330560} + \\ \frac{\left(\frac{2}{3}\right)^2}{2!} \frac{10657}{1330560} - \frac{1}{2!} \frac{5941}{11975040} + (0) \frac{11369}{107775360} + \left(\frac{1}{3} \right) \frac{4423}{2395008} \\ - \left(\frac{2}{3} \right) \frac{7453}{11975040} + \frac{1513}{107775360} \end{array} \right] \\ \left(\frac{2}{3} \right)^4 - \left[\begin{array}{l} (0) \frac{7031}{56133} + \frac{\left(\frac{1}{3}\right)^3}{3!} \frac{302}{693} - \frac{\left(\frac{2}{3}\right)^3}{3!} \frac{71}{693} + \frac{1}{3!} \left(\frac{178}{56133} \right) \\ + (0) \frac{544}{93555} + \frac{\left(\frac{1}{3}\right)^2}{2!} \frac{32}{10395} - \frac{\left(\frac{2}{3}\right)^2}{2!} \frac{32}{10395} - \frac{1}{2!} \frac{92}{280665} \\ + (0) \frac{17}{168399} + \left(\frac{1}{3} \right) \frac{212}{93555} - \left(\frac{2}{3} \right) \frac{19}{93555} + \frac{1}{2!} \frac{8}{841995} \end{array} \right] \end{array} \right] = \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix}$$

\end{aligned}$$

This implies that the block method has order $p=12$ with error constant

$$C_{13} = \left(-\frac{1}{998689595904000}, -\frac{3617}{6552402438726144000}, -\frac{23}{51190644052548000} \right)^T$$

3.2 Consistency and Zero Stability of OCB12 METHOD

The linear multistep method is said to be consistent if it has order $p \geq 1$. Therefore, our method is consistent.

Definition 3.3

A hybrid Block method is said to be zero- stable if the roots Z of the characteristic polynomial $\bar{R}(Z)$ defined by:

$$\bar{R}(Z) = \det [ZA^0 - A']$$

satisfies $|Z| \leq 1$ and every root with $|Z_0| = 1$ has multiplicity not exceeding two in the Limit as $h \rightarrow 0$

Putting equation (6), (7) and (8) in matrix form as a block we obtain:

$$\begin{aligned} & \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} y_{n+\frac{1}{3}} \\ y_{n+\frac{2}{3}} \\ y_{n+1} \end{bmatrix} = \begin{bmatrix} 0 & 0 & 1 \\ 0 & 0 & 1 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} y_{n-\frac{2}{3}} \\ y_{n-\frac{1}{3}} \\ y_n \end{bmatrix} \\ & + h \left(\begin{bmatrix} 0 & 0 & \frac{1283}{9856} \\ 0 & 0 & \frac{912523}{7185024} \\ 0 & 0 & \frac{7031}{56133} \end{bmatrix} \begin{bmatrix} f_{n-\frac{2}{3}} \\ f_{n-\frac{1}{3}} \\ f_n \end{bmatrix} + \begin{bmatrix} \frac{3645}{9856} & \frac{3645}{9856} & \frac{1283}{9856} \\ \frac{23717}{88704} & -\frac{5851}{88704} & \frac{35339}{7185024} \\ \frac{302}{693} & \frac{71}{693} & \frac{178}{56133} \end{bmatrix} \begin{bmatrix} f_{n+\frac{1}{3}} \\ f_{n+\frac{2}{3}} \\ f_{n+1} \end{bmatrix} \right) + \\ & h^2 \left(\begin{bmatrix} 0 & 0 & \frac{311}{49280} \\ 0 & 0 & \frac{214943}{35925120} \\ 0 & 0 & \frac{544}{93555} \end{bmatrix} \begin{bmatrix} g_{n-\frac{2}{3}} \\ g_{n-\frac{1}{3}} \\ g_n \end{bmatrix} + \begin{bmatrix} -\frac{243}{49280} & \frac{243}{49280} & -\frac{311}{49280} \\ -\frac{10657}{1330560} & \frac{10657}{1330560} & -\frac{5941}{11975040} \\ \frac{32}{10395} & -\frac{32}{10395} & -\frac{92}{280665} \end{bmatrix} \begin{bmatrix} g_{n+\frac{1}{3}} \\ g_{n+\frac{2}{3}} \\ g_{n+1} \end{bmatrix} \right) + \\ & + h^3 \left(\begin{bmatrix} 0 & 0 & \frac{17}{147840} \\ 0 & 0 & \frac{11369}{107775360} \\ 0 & 0 & \frac{17}{168399} \end{bmatrix} \begin{bmatrix} p_{n-\frac{2}{3}} \\ p_{n-\frac{1}{3}} \\ p_n \end{bmatrix} + \begin{bmatrix} \frac{81}{49280} & \frac{81}{49280} & \frac{17}{147840} \\ \frac{4423}{2395008} & -\frac{7453}{11975040} & \frac{1513}{107775360} \\ \frac{212}{93555} & -\frac{19}{93555} & \frac{8}{841995} \end{bmatrix} \begin{bmatrix} p_{n+\frac{1}{3}} \\ p_{n+\frac{2}{3}} \\ p_{n+1} \end{bmatrix} \right) \end{aligned}$$

The following matrix difference equation will be in form of:

$$A^0 y_{n+1} = A^{(0)} y_{n-1} + h [B^{(0)} f_{n-1} + B' f_n] + h^2 [C^{(0)} g_{n-1} + C' g_n] + h^3 [D^{(0)} p_{n-1} + D' p_n]$$

The first characteristics polynomial of the above matrix is given by

$$R(Z) = \det [ZA^0 - A']$$

$$A^0 = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}, A' = \begin{bmatrix} 0 & 0 & 1 \\ 0 & 0 & 1 \\ 0 & 0 & 1 \end{bmatrix}$$

$$\begin{aligned}
 R(Z) &= \det \left[Z \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} - \begin{bmatrix} 0 & 0 & 1 \\ 0 & 0 & 1 \\ 0 & 0 & 1 \end{bmatrix} \right] \\
 &= \det \left[\begin{bmatrix} Z & 0 & 0 \\ 0 & Z & 0 \\ 0 & 0 & Z \end{bmatrix} - \begin{bmatrix} 0 & 0 & 1 \\ 0 & 0 & 1 \\ 0 & 0 & 1 \end{bmatrix} \right] = \det \begin{bmatrix} Z & 0 & -1 \\ 0 & Z & -1 \\ 0 & 0 & Z-1 \end{bmatrix}
 \end{aligned}$$

$$R(Z) = Z^2(z-1)$$

$$R(Z) = 0$$

then the roots of $R(Z) = 0$ satisfy $R(Z) \leq 1$

Hence, the block method is said to be zero-stable. Therefore, since the block method is consistent and zero-stable, it is likewise convergent.

4.0 IMPLEMENTATION OF OCB12 METHOD.

In this section we solve some tested IVPs with Maple software to determine the efficiency and usability of OCB12 method with other existing methods.

Problem 1: [10]

$$\dot{y} = 0.5(1-y), y(0) = 0.5, h = 0.1 \text{ with exact solution } y(x) = 1 - 0.5e^{-0.5x}$$

Problem 2: [1]

$$\dot{y} = -y, y(0) = 1, h = 0.1 \text{ with exact solution } y(x) = e^{-x}$$

Problem 3: [14]

$$\dot{y} = y, y(0) = 1, h = 0.1 \text{ with exact solution } y(x) = e^x$$

CONCLUSION

In this paper, we have presented an implicit one-step third Derivative hybrid Block Method for Solution of first order initial value problems in ordinary differential equations. The property of the method has shown its convergence and the numerical problems considered have likewise shown its superiority over previously existing methods in literature.
