**Abstract:** In the current situation, every profession is competing against one another. The employment market also reflects this. An online resource for information about both job seekers and recruiters is known as a job portal. Finding the ideal company for employees is made easier by a job portal for both job searchers and recruiters. The job portal presents the job seeker with a list of companies based on their educational background, prior work experience, and personal interests. And from a pool of applicants, it gives the recruiters the qualified individuals. The development of a system that enables communication between employers and applicants is the goal of this application. The goal is to facilitate communication between interested parties and expeditiously conclude the recruitment process.

## INTRODUCTRION:

Building a web-based scan Portal for the employee who is the primary objective of this particular assignment. The structure is an internet application which can be accessed by anyone through the affiliation as well as outside of it with a legitimate login provided. This system has the potential to be used by the each and every employee as an Online Employment Portal in order to manage the students' information regarding their employment situations. Undergraduates who keep a log ought to have the option to export their data as a CV. Additionally, Guests/Company sellers logging in have the ability to access and search any data that was set up with the assistance of admin. It is desired that the task have the viewpoint on disseminated design, along with the capability of integrated statistics set. The software necessary for the ability to access the data has been set up. Utilizing this same builds of Microsoft SQL Server, and each user interface has been carefully crafted using PHP's most recent developments. The strategy known as "SQL Connection" is used in order to organize the availability of the statistics set. The facts of protection and the norms of defensive tool the past provided a predominant selection of respectable use. This application deals with a number of modules and the reports that are associated with them. These modules and reports are delivered in accordance with the appropriate methodologies and concepts that have been put forth by the employer

## RELATED WORK:

The purpose of the job portal is to make it easier for both job seekers and employers to find staff for their businesses. Any job seeker can access this online application at any time and look for open positions with the most recent information. When he locates a position, he can submit an online application. Employers can submit job information with eligibility requirements by signing up for a membership, logging in, and posting job openings. Through the use of this software, a direct connection is made between the employer and the job applicant. A job seeker can visit this portal immediately and read the information on open positions as well as download the necessary documents. He would be able to upload his application and publish walk-in data after logging onto the system, both of which he is aware would be retained by a corporation. Other users are greatly aided in attending the same events by this information. The user will also be able to see a list of the companies that ha has already applied to. This gives him the ability to decide how to respond to a call from a firm and how long it has been since he submitted an application. The existing system in this case is nothing more than an already-existing job site created with platform-independent technologies like ASP, PHP, etc. It does not give a practical technique for minimising unneeded information for end user acceptability and does not allow for effectively catering to the demands of all types of users (Job Seekers, Employers, and Administrators).

## METHODOLOGY:

The major goal of this project is to solve some of the issues that the previous system had. The biggest issue was the unnecessarily long time it took to generate the necessary information after taking all extra data into account. It gives consumers an effective means to share information among themselves in order to meet their demands. Both employers and job seekers can use it completely. It is a dedicated career platform created exclusively for the benefit of job seekers.

**CONCLUSION:**

I feel an enormous joy that I have never felt before when I consider how tough and wonderful this project is. This experience was very great for me because it gave me practical knowledge on not only programming in programming languages and digital implementation, but also basically all managerial framework related to "Online Career Portal." Additionally, it provides information on the newest technological developments used in the creation of web-based engaged applications and client server development, both of which will be of utmost interest in the near future. This will offer better entry points and guidance for making projects without limitations in the future.
